Applying the Decorator Design Pattern

Trenton Computer Festival Professional Seminars April 21, 2006

> Michael P. Redlich (908) 730-3416 michael.p.redlich@exxonmobil.com

About Myself

Degree

- B.S. in Computer Science
- Rutgers University (go Scarlet Knights!)
- ExxonMobil Research & Engineering
 - Clinton, New Jersey
 - Senior Research Technician (1988-1998, 2004-present)
 - Systems Analyst (1998-2002)
- Ai-Logix, Inc.
 - Somerset, New Jersey
 - Technical Support Engineer (2003-2004)

About Myself (continued)

- ACGNJ
 - Java Users Group Leader
 - Secretary
- Publications
 - "Avoid Excessive Subclassing with the Decorator Design Pattern"
 - + Barry Burd and Michael Redlich
 - + Java Boutique, January 27, 2006
 - "James: The Java Apache Mail Enterprise Server"
 - + Barry Burd and Michael Redlich
 - + Java Boutique, September 30, 2005

The example source code was adapted from:

- Head First Design Patterns
 - + Eric & Elisabeth Freeman (with Kathy Sierra & Bert Bates)
- Download example source code from:
 - <u>http://tcf.redlich.net/</u>

Gang of Four (GoF)

- Erich Gamma
- Richard Helm
- Ralph Johnson
- John Vlissides
- Design Patterns Elements of Reusable Object-Oriented Software
 - ISBN 0-201-63361-2
 - 1995

Gang of Four (GoF) Next Generation?

- Eric Freeman
- Elisabeth Freeman
- Kathy Sierra
- Bert Bates
- Head First Design Patterns
 - ISBN 0-596-00712-4
 - 2004

- A <u>pattern</u> is a solution to a problem in a context
- The <u>context</u> is the situation in which the pattern applies
- The <u>problem</u> refers to the desired goal in the context, but also refers to any constraints that may occur
- The solution is a general design that anyone can apply

"If you find yourself in a context with a problem that has a goal that is affected by a set of constraints, then you can apply a design that resolves the goal and constraints and leads to a solution."

What are Design Patterns? (continued)

- Recurring <u>solutions</u> to software design <u>problems</u> that are <u>repeatedly</u> found in real-world application development
- All about the <u>design</u> and <u>interaction</u> of objects
- Four essential elements:
 - The pattern name
 - The problem
 - The solution
 - The consequences

How Design Patterns Solve Design Problems

- Find appropriate objects
 - Helps identify less obvious abstractions
- Design for change
 - Avoid creating objects directly
 - Avoid dependencies on specific operations
 - Avoid algorithmic dependencies
 - Avoid tight coupling

Thinking in Design Patterns

- Keep it simple
 - Goal should be simplicity
- Design patterns are not a magic bullet
 - No "plug and play"
- Know when to apply a design pattern
 - Ensure that a pattern fits the design
- Consider patterns during refactoring
 - Goal is to improve structure, not behavior
- Don't be afraid to remove a design pattern
 - Especially if design has become too complex

Design Pattern Categories

- Creational
 - Abstracts the instantiation process
 - Dynamically create objects so that they don't have to be instantiated directly
- Structural
 - Composes groups of objects into larger structures
- Behavioral
 - Defines communication among objects in a given system
 - Provides better control of flow in a complex application

Creational Patterns

Abstract Factory

- Provides an interface for creating related objects without specifying their concrete classes
- Builder
 - Reuses the construction process of a complex object
- Factory Method
 - Lets subclasses decide which class to instantiate from a defined interface
- Prototype
 - Creates new objects by copying a prototype

Creational Patterns (continued)

- Singleton
 - Ensures a class has only one instance with a global point of access to it

- Adapter
 - Converts the interface of one class to an interface of another
- Bridge
 - Decouples an abstraction from its implementation
- Composite
 - Composes objects into tree structures to represent hierarchies
- Decorator
 - Attaches responsibilities to an object dynamically

Structural Patterns (continued)

- Façade
 - Provides a unified interface to a set of interfaces
- Flyweight
 - Supports large numbers of fine-grained objects by sharing
- Proxy
 - Provides a surrogate for another object to control access to it

Behavioral Patterns

Chain of Responsibility

- Passes a request along a chain of objects until the appropriate one handles it
- Command
 - Encapsulates a request as an object
- Interpreter
 - Defines a representation and an interpreter for a language grammar
- Iterator
 - Provides a way to access elements of an object sequentially without exposing its implementation

Behavioral Patterns (continued)

- Mediator
 - Defines an object that encapsulates how a set of objects interact
- Memento
 - Captures an object's internal state so that it can be later restored to that state if necessary
- Observer
 - Defines a one-to-many dependency among objects
- State
 - Allows an object to alter its behavior when its internal state changes

Behavioral Patterns (continued)

- Strategy
 - Encapsulates a set of algorithms individually and makes them interchangeable
- Template Method
 - Lets subclasses redefine certain steps of an algorithm
- Visitor
 - Defines a new operation without changing the classes on which it operates

- Objective:
 - Update an existing coffee shop application design due to expansion

What about using additional instance variables to keep track of the condiments?

Beverage
description
milk
soy
mocha
whip
getDescription
cost
hasMilk
setMilk
hasSoy
setSoy
hasMocha
setMocha
hasWhip
setWhip

IS THIS A BETTER DESIGN?

- Intent
 - Attaches additional responsibilities to an object dynamically
 - Provides a flexible alternative to subclassing for extending functionality
- Also known as
 - Wrapper
- Motivation
 - Allows classes to be easily extended to incorporate new behavior without modifying existing code

Decorator (continued)

Design Principle

- Classes should be open for extension, but closed for modification
- Use this pattern:
 - To add responsibilities to individual objects dynamically and transparently without affecting other objects
 - For responsibilities that can be withdrawn
 - When extension by subclassing is impractical

Decorator (continued)

Constructing a Drink Order With Decorators

Revised Coffee Shop Application

• ...for the code review and demonstration!
